

# CENTRALIZER

for Deep Anode Systems

The MATCOR anode centralizer is a non-metallic, PVC welded assembly used to hold the anode, cable and vent pipe in the center of a deep anode cathodic protection system. The sturdy centralizer will easily slide into the borehole without sharp edges to catch on irregular surfaces. It is manufactured with holes for attaching the supplied plastic cable ties used for securing the vent pipe and the anode.

## INSTALLATION

The centralizer is easy to use. Attach the centralizer with the provided cable ties to the vent pipe in the location of each anode. Then attach each anode to the centralizer with the cable ties. For longer anodes, two centralizers may be advisable. In case where the anodes are far apart, one or more additional centralizers may be installed between the anodes.

*MATCOR's SuperVent™ is recommended for use with the Centralizer to ensure continuous venting and prevent blockage.*

## BENEFITS

Non-metallic, will not damage the anode cable or cause electrical short

Easy to install

Secures anode and vent pipe

Installs without hang-ups

# CENTRALIZER

for Deep Anode Systems

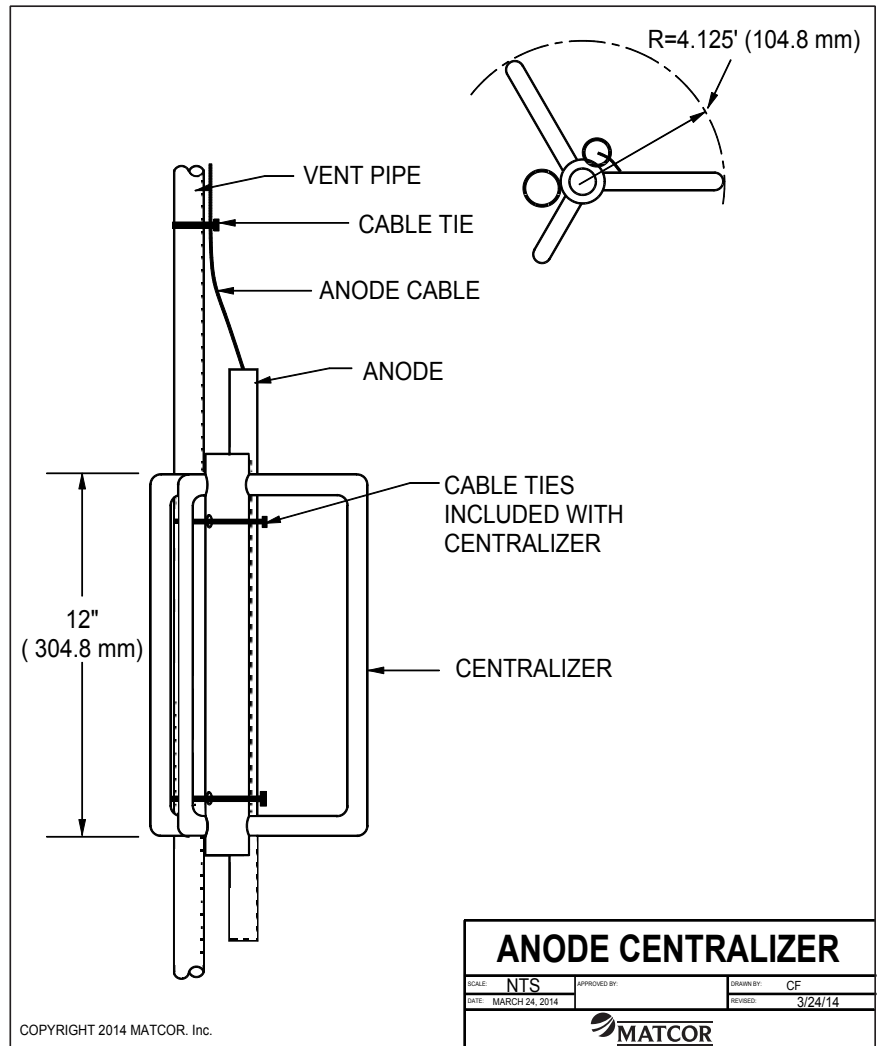

## RECOMMENDATIONS

When installing a non-MATCOR field assembled deep anode system that requires centralizers, use the MATCOR SuperVent™ Deep Anode Venting System to prevent vent pipe blockage and to ensure continuous venting of the deep anode cathodic protection system.

The MATCOR Durammo™ Deep Anode system is the only complete, factory assembled, ready to install deep anode system available and does not require anode centralizers. Thousands of self centering Durammo Deep Anode Systems, in operation for more than 200 million hours over 30 years, have successfully protected pipelines, wells, plants and infrastructure from corrosion.

The MATCOR Durammo™ Deep Anode system does not require anode centralizers.
